PROFESSIONAL SUMMARY

Pharmacist with 11+ years in Saudi retail pharmacy who builds data pipelines and dashboards. Built an end-to-end data platform on Microsoft Fabric (PySpark, T-SQL, Power BI) for a synthetic 1,000-branch pharmacy chain, reconciled 60 million rows to the source, and traced 99.8% of the loss below cost to 314 products. In the pharmacy, grew branch insurance sales about 3x and daily sales by about 13% by fixing availability and merchandising.

SELECTED RESULTS

- Insurance sales about **3x** in four years and branch sales about **+75%** (as branch manager of a two-person team, through hospital relationships and service reputation).
- Daily branch sales about **+13%** for three consecutive months by fixing stock-outs, availability and merchandising.
- About **5,000 items** counted in 5 days and reconciled automatically during a full branch relocation.
- **60 million rows** reconciled from source to report with zero difference in a Microsoft Fabric data platform.

SKILLS

Data engineering: Microsoft Fabric (Lakehouse, Warehouse), PySpark, Delta Lake, T-SQL (stored procedures, CTEs, window functions), star schema, Medallion architecture, data reconciliation, Git

Analytics and BI: Power BI (Direct Lake, DAX, TMDL, Power Query), Tableau, Excel and LibreOffice Calc (pivot tables), Python (pandas, NumPy)

Pharmacy domain: retail pharmacy operations, insurance claims, inventory and stock counts, merchandising, product availability, KPI design

PROFESSIONAL EXPERIENCE

Pharmacist | Al-Dawaa Medical Services Company | Al-Ahsa, Saudi Arabia **Feb 2015 – Present**

Three branches, each with a different business challenge.

- More than eight years handling branch management responsibilities: staff coordination, stock, insurance and daily sales.
- **Branch 1 (5 years; branch manager for 4, team of two):** built the branch's reputation and working relationships with nearby hospitals; over four years insurance sales grew about 3x and total branch sales about 75% by the time I transferred.
- **Branch 2:** took ownership of the underperforming medical devices category; trained colleagues to explain and recommend devices to patients.
- **Branch 3 (current):** diagnosed stock-outs, product availability and merchandising gaps; raised average daily sales by about 13% for three consecutive months.
- Co-led a **full branch relocation**: counted about 5,000 items in 5 days and re-shelved them in 4, matching transfer lines against multi-day counts by item code (LibreOffice Calc, pivot tables) to produce excess and shortage reports without manual item checks. Turned a worried team into a confident one, and documented the method as a 19-page manual for future transfers.

Pharmacist | Misr Pharmacies | Giza, Egypt **Oct 2013 – Dec 2014**

- Dispensing, patient counselling and daily community pharmacy operations; first exposure to stock control and supplier orders.

SELECTED PROJECTS

Pharmacy Enterprise Data Warehouse | Microsoft Fabric, PySpark, T-SQL, Power BI **2026**

- Ingested 72 source tables (60,234,021 rows) into a Lakehouse with PySpark, reconciled to source with zero difference, and cleaned 58 Silver tables.
- Designed a Gold star schema (9 dimensions, 9 facts, 4 analytical tables) rebuilt by 23 stored procedures in about 2 minutes; versioned with Fabric Git integration.
- Built a 6-page Direct Lake Power BI report showing that 314 products bought at about 10x their selling price cause 99.8% of the loss below cost; found and fixed a scoring bug in my own Gold layer before publishing.
- Applied pharmacy judgment to the analysis: customer returns kept out of staff scoring, no invented expiry metric where data was missing, and no person blamed without evidence (7 integrity signals tested against chance).
- Case study: shamsinsights.com/pharmacy-dw.html | Code: github.com/shamseldeen/pharmacy-enterprise-data-warehouse

Saudi Pharma Commercial Intelligence | Power BI, DAX, Power Query **2026**

- Modeled 150,000 synthetic sales lines and 48,613 invoices (3 facts, 7 dimensions) into a 6-page live report with 70 DAX measures.
- Showed net sales at 97.18% of target and SAR 825K of stock at expiry risk across 115 positions. Case study: shamsinsights.com/saudi-pharma.html

Food Composition and Calorie Modeling | Python, pandas, statsmodels **2023, reviewed 2026**

- Analyzed 7,793 food records across 25 categories, standardized nutrient units and compared three OLS models with explicit limitations. Case study: shamsinsights.com/nutrition.html

EDUCATION AND TRAINING

Bachelor of Pharmacy | Alexandria University **2013**

DataCamp: 74 courses and 7 completed tracks: Data Analyst in Python; Data Scientist in Python; Python Data Fundamentals; SQL Fundamentals; Data Manipulation in Python; Statistics Fundamentals in Python; Importing and Cleaning Data in Python. 25 guided projects in SQL, Python, statistics and machine learning.

Additional training: SQL (30 hours), Tableau (20 hours). Full list: shamsinsights.com/learning.html
